

INTERNATIONAL HAZARDOUS WASTE SERVICES

global protection for you
and your organisation

 **VEOLIA**
ENVIRONMENTAL
SERVICES

proven solutions for waste management and environmental remediation

Environmental issues are a concern throughout the world, but even more so where there are no local resources or infrastructures in place to effectively manage these concerns. Here at Veolia Environmental Services, we are committed to delivering sustainable, responsible and economically viable waste management solutions and services, whilst protecting and caring for the welfare and development of the environment and local communities in which we operate. We conduct our activities fairly and with integrity, and in compliance with best business standards in terms of corporate governance.

A wealth of experience in hazardous wastes

Offering a truly worldwide service in specialist hazardous waste and clean-up solutions, Veolia Environmental Services has an unrivalled reputation for practical and economical solutions, with a dedicated international team to advise on the best practical environmental options and an enviable track record in the responsible handling of hazardous materials, industrial services and decontamination.

Local presence

Supported by our extensive network of local resources, we offer a single point of contact to provide technical support and guide you through the legislative framework. Our operations are delivered in the field with the utmost care for the environment, the law and the health and safety of those directly or indirectly involved.

Advanced solutions to today's problems

With extensive project management experience, a range of treatment technologies and full logistical support, we provide turnkey solutions for the removal, treatment and disposal of all hazardous substances, including PCBs and pesticides, plus land and building remediation, clean up and decommissioning.

on-site project management

From the complete demolition of a chemical plant and the removal of contamination prior to re-development of a site to the decontamination and decommissioning of laboratory or hospital premises, we have the experience, resources and technical expertise to offer you the most appropriate solution.

Extensive industry experience

Complex one-off projects can be greatly facilitated by our On-Site Project Management Services, which have delivered significant benefits to a wide range of customers including government bodies, pharmaceutical research centres, schools and universities, chemical manufacturers and utilities and distribution companies.

A carefully controlled process

We offer a complete service from a tailor-made team, with a dedicated Project Manager as your single point of contact for the duration. Leaving no stone unturned, we develop a project management plan against a critical path/time frame, supported by regular progress meetings and reviews, plus a final review and report.

A tailor-made service

In order to develop the most cost-effective solution, we first undertake a complete site assessment that includes such key considerations as risk assessment, health & safety and safe working methods, to deliver the most appropriate recycling and disposal options including treatment, incineration or landfill to suit your requirements.

Cost-effective solutions

Our services cover a wide range of requirements such as decontamination, contaminated land remediation and chemical plant decommissioning and demolition. In addition we offer cost-effective packages, which are normally UN approved for safe, legal transportation to the disposal site.

high temperature incineration

For certain categories of waste including Persistent Organic Pollutants (POPS) and confidential materials, only the highest levels of secure destruction are appropriate in order to satisfy both commercial and legislative requirements. In these cases, High Temperature Incineration is frequently the most cost-effective solution.

The safest option

A proven solution for the safe disposal of hazardous organic chemicals and those more intractable materials that are unsuitable for treatment by other technologies, High Temperature Incineration is widely regarded as the best practical environmental option (BPEO) for chemical and confidential wastes.

Secure disposal assured

The process, which involves heating to temperatures in excess of 1100°C, delivers a destruction efficiency of 99.99% and is ideally suited to the secure disposal of hazardous by-products, redundant or obsolete products, laboratory waste and agents, contaminated electrical equipment and contaminated soils.

Meeting environmental standards

The exceptionally high efficiency of this process is matched by outstanding performance in the environmental arena. For your further assurance, we use the latest technology at every stage in order to achieve legislative conformity.

Total flexibility to suit your needs

Meeting all authorisations and legislative requirements, we offer maximum flexibility for the handling and receiving of a wide range of materials and offer considerable experience of transportation and logistics to ensure safe and rapid transit at all times, whatever the destination.

PCB management

Continuing industrial development and the expansion of electrical utilities around the world mean that many potential problems can occur due to leaking or life-expired electrical equipment, contaminated soil or dielectric fluid - all of which may contain polychlorinated biphenyls (PCBs) that must be properly controlled.

Ensuring your complete protection

Backed by a proven history of successful PCB decommissioning, we provide a range of solutions to address the potential health, environmental, legal and insurance problems, offering tailored services to meet your needs supported by technical help and advice from specialists trained in international safety procedures.

Minimising your costs and disruption

Following on-site surveys and sample analysis to identify exact levels of contaminated materials, we recommend the most cost-effective and appropriate programme. Our project-managed specialist team handles decommissioning, decontamination, packaging and labelling, leaving you free to manage your operations.

Satisfying your legal obligations

Helping to meet legislative requirements and protect you from litigation, our services address health and environmental problems with incinerator destruction to ensure the best possible environmental option (BPEO), transboundary compliant logistical support from origin to disposal and certification to eliminate future liabilities.

A complete service to meet all needs

We undertake complete turnkey projects in conjunction with manufacturers and contractors, and can handle a range of packages and quantities. Our services cover a wide range of remediation, for example contaminated soils, dioxin contamination after a fire and the repackaging of leaking electrical equipment.

obsolete pesticides management

Dangerous, often banned pesticides have accumulated throughout the world, particularly in developing countries. In many cases, leakage from deteriorating packaging can contaminate the local surroundings, which can cause potentially disastrous effects upon both the environment and the health of the population.

Countering the pesticides threat

Backed by a proven history of successful clean up operations around the world and also of handling many problems in developing countries, we help protect both people and the environment. Our services include the decontamination of pesticide stores to allow re-use and the repackaging of obsolete pesticides to international standards.

Taking control of the situation

To ensure successful completion and meet EU directives, we operate a risk-assessment based project-managed strategy. From on-site surveys, which provide an inventory of obsolete stocks, we identify the most cost-effective clean up programme then effect disposal via our in-house incineration capabilities.

Delivering local solutions

Taking positive steps towards protecting both people and the environment from pesticides, our field teams handle all aspects of in-country operations and international logistics. In addition, we provide training for local staff, including key safety requirements, and help the sustainable development process.

Meeting legislative requirements

Offering complete in-house turnkey solutions from inventory to repackaging, logistics and destruction, we provide full transboundary legislation-compliant logistical support from origin to disposal, management of TFS documentation as required under the Basel Convention and certification of destruction.
